

1. smbclient

A built-in tool in Kali Linux that allows interaction with SMB servers.

Command:

bash

Copy code

```
smbclient -L //<target-ip> -U <username>
```

- **-L**: Lists the available shares on the SMB server.
 - **<target-ip>**: Replace with the target's IP address.
 - **<username>**: Replace with a valid username or leave it blank for anonymous login.
-

2. enum4linux

A popular tool specifically for SMB enumeration in a Windows environment.

Command:

bash

Copy code

```
enum4linux -a <target-ip>
```

- **-a**: Performs all enumeration options (users, shares, OS details, etc.).
-

3. **smbmap**

Provides a detailed overview of shares, permissions, and potential access.

Command:

bash

Copy code

```
smbmap -H <target-ip>
```

- **-H**: Specifies the host to enumerate.
 - Use **-u <username>** and **-p <password>** to specify credentials if required.
-

4. **nmap with SMB scripts**

Nmap's scripting engine includes SMB-related scripts.

Command:

bash

Copy code

```
nmap -p 139,445 --script smb-enum-shares,smb-enum-users  
<target-ip>
```

- **-p 139,445**: Scans SMB-related ports.
 - **--script smb-enum-shares,smb-enum-users**: Executes scripts for enumerating shares and users.
-

5. **crackmapexec**

A versatile tool for assessing SMB shares, user enumeration, and vulnerabilities.

Command:

bash

Copy code

```
crackmapexec smb <target-ip>
```

- Replace **<target-ip>** with the IP address of the target machine.
